

Explanatory Material [SRC_INPUT_FILE_VAL_CNV_E]

1. Function Overview

After searching for the unit of measure item in the Input File for BAPI, refer to the conversion sheet and convert it to an internal unit of measure (In order to create data using BAPI, the Unit of Measure must be created in the internal unit of measure.)
(With SRC_BAPIv2.2_VAL_TBL_EXPORT_E you can obtain internal and external unit of measure information from SAP, or if it is in the same format, use the conversion table created manually.)

2. Function Diagram

3. How to Use

The following Argument information must be entered in Argument File.

<Input>

Property	Type	Description	Required
in_ConvertFilePath	String	The file path of the Input File you want to convert in units of measure (set the relative or full path.)	Yes
in_UomFilePath	String	File path of the conversion sheet (set relative or full path.)	Yes
in_UomSheetName	String	Enter the sheet name to extract from the conversion sheets.	Yes

4. Reference

The input contents of Argument File are as follows.

Property	Description	Required
ConvertFilePath	The file path of the Input File you want to convert in units of measure (set the relative or full path.)	Yes
UomFilePath	File path of the conversion sheet (set relative or full path.)	Yes
UomSheetName	Enter the sheet name to extract from the conversion sheets.	Yes

About conversion sheets

Conversion sheets can be created by SRC_BAPIv2.2_VAL_TBL_EXPORT_E.
In addition, it is also possible to create and use the following sheet separately.

MSEHI	MSEH3	MSEHI : Internal Unit of Measure
ST	PC	MSEH3 : External Unit of Measure
10	D	-> Do not change the name of MSEHI/MSEH3 fields.
SET	Expression	

5. Important Notes

- Do not start Excel when executing.
